| MEMBUAT FITUR EDIT DAN DELETE DATA PADA POSTINGAN .....         | 47 |
| Task 5: .....   | 52 |

## MEMULAI PROJEK LARAVEL

1. Download dan install aplikasi Composer pada link dibawah ini  
<https://getcomposer.org/download/>
2. Jalankan perintah dibawah untuk membuat project Laravel, atau bisa juga mengacu ke documentation Laravel pada <https://laravel.com/docs/>  
`composer create-project laravel/laravel laravelpost`
3. Jika project sudah jadi, maka akan muncul file dan folder dengan struktur seperti dibawah

|   |                |                  |                        |        |
|---|----------------|------------------|------------------------|--------|
|    | app            | 29/08/2023 9:33  | File folder            |        |
|    | bootstrap      | 29/08/2023 9:33  | File folder            |        |
|    | config         | 29/08/2023 9:33  | File folder            |        |
|    | database       | 29/08/2023 9:33  | File folder            |        |
|    | public         | 30/08/2023 8:20  | File folder            |        |
|    | resources      | 29/08/2023 9:33  | File folder            |        |
|    | routes         | 29/08/2023 9:33  | File folder            |        |
|    | storage        | 29/08/2023 9:33  | File folder            |        |
|    | tests          | 29/08/2023 9:33  | File folder            |        |
|    | vendor         | 25/10/2023 15:04 | File folder            |        |
|   | .editorconfig  | 29/08/2023 9:33  | Editor Config Sour...  | 1 KB   |
|  | .env           | 01/09/2023 14:04 | ENV File               | 1 KB   |

|  | package.json   | 29/08/2023 9:33  | JSON Source File       | 1 KB   |
|  | phpunit.xml    | 29/08/2023 9:33  | XML Document           | 2 KB   |
|  | README.md      | 29/08/2023 9:33  | Markdown Source...     | 4 KB   |
|  | server.php     | 29/08/2023 9:33  | PHP Source File        | 1 KB   |
|  | webpack.mix.js | 29/08/2023 9:33  | JavaScript File        | 1 KB   |

4. Jalankan aplikasi menggunakan script “php artisan serve”, lalu ctrl+klik pada IP yang tersedia.  
Atau jalankan url laravelpost.test

### Documentation

Laravel has wonderful, thorough documentation covering every aspect of the framework. Whether you are new to the framework or have previous experience with Laravel, we recommend reading all of the documentation from beginning to end.

### Laracasts

Laracasts offers thousands of video tutorials on Laravel, PHP, and JavaScript development. Check them out, see for yourself, and massively level up your development skills in the process.

### Laravel News

Laravel News is a community driven portal and newsletter aggregating all of the latest and most important news in the Laravel ecosystem, including new package releases and tutorials.

### Vibrant Ecosystem

Laravel's robust library of first-party tools and libraries, such as [Forge](#), [Vapor](#), [Nova](#), and [Envoyer](#) help you take your projects to the next level. Pair them with powerful open source libraries like [Cashier](#), [Dusk](#), [Echo](#), [Horizon](#), [Sanctum](#), [Telescope](#), and more.

[Shop](#) [Sponsor](#)

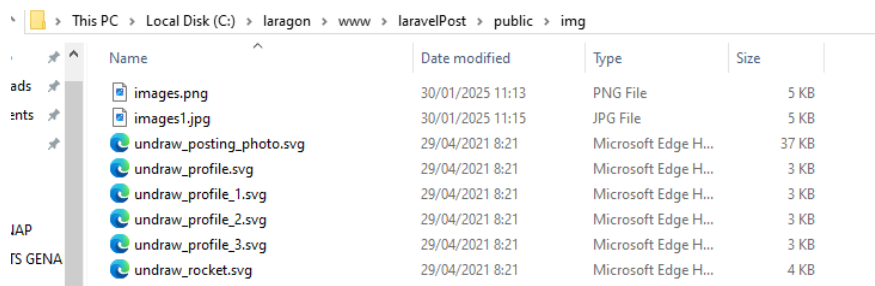

Laravel v6.50.0 (PHP v8.0.8)

## MEMBUAT PAGE TAMPILAN BARU DI LARAVEL

1. Buka aplikasi vscode dan buka folder pada project Laravel yang sudah dibuat.
2. Download folder assets, css, img, js yang telah disediakan dan letakkan pada folder “public”.

3. Letakkan gambar yang tersedia kedalam folder img

4. Buka folder routes/web.php untuk membuat rute link yang ingin dituju

```
Route::get('/about', function () {  
  
    return view('about',[  
  
        "title" => 'About',  
  
        "active" => 'about',  
  
        "name" => "Lulu Kumulu",  
  
        "email" => "lulukumulu@gmail.com",  
  
        "image" => "user2.png"  
  
    ]);  
  
});
```

5. Buka folder resource/view dan buat folder dengan nama layout, dan buat file dengan nama main.blade.php didalam folder tersebut

```
<!DOCTYPE html>

<html lang="en">

<head>

    <meta charset="utf-8">

    <meta http-equiv="X-UA-Compatible" content="IE=edge">

    <meta name="viewport" content="width=device-width, initial-scale=1, shrink-to-fit=no">

    <meta name="description" content="">

    <meta name="author" content="">

    <title>Web Blog</title>

    <!-- Custom fonts for this template-->

    <link href="{{asset('vendor/fontawesome-free/css/all.min.css')}}" rel="stylesheet"
type="text/css">

    <link
href="{{asset('https://fonts.googleapis.com/css?family=Nunito:200,200i,300,300i,400,400i,600,6
00i,700,700i,800,800i,900,900i')}}"
rel="stylesheet">

    <!-- Custom styles for this template-->

    <link href="{{asset('css/sb-admin-2.min.css')}}" rel="stylesheet">

    <!-- Bootstrap icons -->

    <link rel="stylesheet" href="https://cdn.jsdelivr.net/npm/bootstrap-
icons@1.11.1/font/bootstrap-icons.css">
```

```

```
    <i class="fas fa-fw fa-table"></i>
```

```
    <span>My Posts</span></a>
```

```
</li>
```

```
</ul>
```

```

        <!-- Content Wrapper -->

        <div id="content-wrapper" class="d-flex flex-column">

            <!-- Main Content -->

            <div id="content">

                <div class="container mt-4">

                    @yield('container')

                </div>

            </div>

        </div>

        <!-- Bootstrap core JavaScript-->

        <script src="{{asset('vendor/jquery/jquery.min.js')}}"></script>

        <script src="{{asset('vendor/bootstrap/js/bootstrap.bundle.min.js')}}"></script>

        <!-- Core plugin JavaScript-->

        <script src="{{asset('vendor/jquery-easing/jquery.easing.min.js')}}"></script>

        <!-- Custom scripts for all pages-->

        <script src="{{asset('js/sb-admin-2.min.js')}}"></script>

        <script src="https://unpkg.com/feather-icons"></script>

        <script>

            feather.replace();

        </script>

    </body>

</html>

```

6. Tambahkan file dengan nama about.blade.php pada resource/view dengan isi sebagai berikut

```
@extends('layout.main')
```

```
@section('container')
```

```
<span align="center" ><h2>Halaman {{$title}}</h2></span>
```

```
<form class="d-none d-sm-inline-block form-inline mr-auto ml-md-3 my-2 my-md-0 mw-100 navbar-search">
```

```
    <div class="card" style="width: 18rem;">
```

```
        
```

```
        <div class="card-body">
```

```
            <h5 class="card-title">{{$name}}</h5>
```

```
            <p class="card-text">Some quick example text to build on the card title and make up the bulk of the card's content.</p>
```

```
            <a href="#" class="btn btn-primary"><?= $email; ?></a>
```

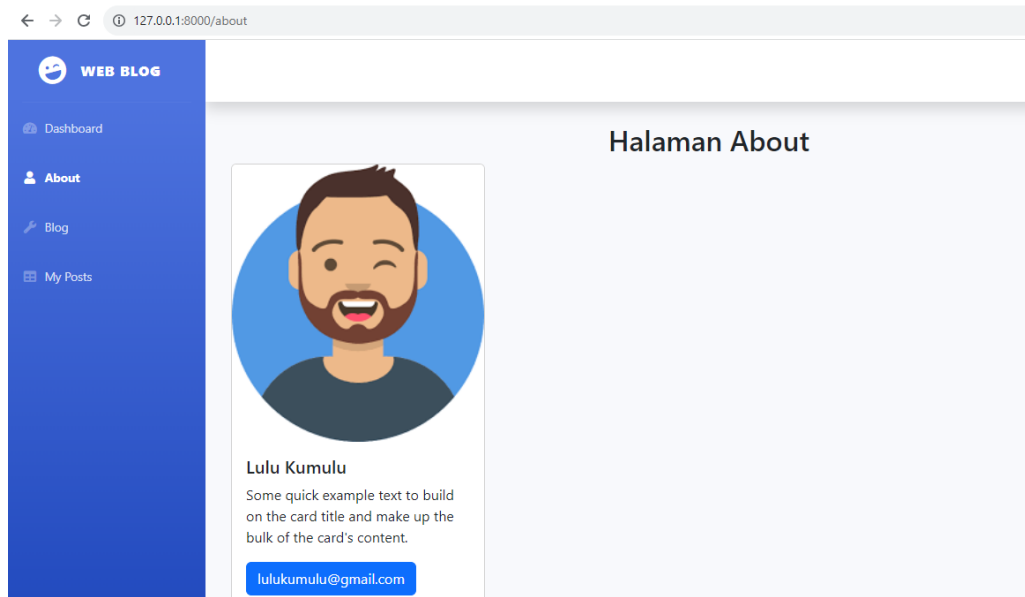

```
        </div>
```

```
    </div>
```

```
</form>
```

```
@endsection
```

7. Jalankan aplikasi menggunakan script "php artisan serve", lalu ctrl+klik pada IP yang tersedia. Lalu tambahkan "/about" pada browser.

Task 1:

1. **BUATLAH 1 MENU DAN PAGE YANG BERISI TABLE BEBAS DAN TAMPILKAN!**

## MEMBUAT DATABASE MENGGUNAKAN LARAVEL

1. Untuk mengkoneksikan database dengan Laravel kita harus menuliskan nama database yang kita punya pada file .env

```

1 APP_NAME=Laravel
2 APP_ENV=local
3 APP_KEY=base64:M19ztZpHaQ9KDfpwVQXyHBmIJngOKbYOMkyJL/r5Dhg=
4 APP_DEBUG=true
5 APP_URL=http://lat-laravel.test/
6
7 LOG_CHANNEL=stack
8 LOG_DEPRECATIONS_CHANNEL=null
9 LOG_LEVEL=debug
10
11 DB_CONNECTION=mysql
12 DB_HOST=127.0.0.1
13 DB_PORT=3306
14 DB_DATABASE=blogging
15 DB_USERNAME=root
16 DB_PASSWORD=
17

```

2. Klik tab Extension pada vscode. Lalu cari dan download ekstensi Laravel Artisan dan PHP Namespace.

3. Buka folder database/migration. Didalam folder tersebut akan ditemukan beberapa file migration yang akan berguna untuk membuat struktur database dan tabel otomatis dari Laravel tanpa berhubungan langsung dengan DBMS.
4. Ketikkan perintah “php artisan migrate:fresh” pada terminal untuk membuat database dan tabel sesuai default.
5. Gunakan shortcut CTRL+SHIFT+P lalu ketikkan migration->create\_posts\_table->Yes->posts.
6. Lalu tunggu hingga proses selesai. Tambahkan perintah struktur tabel seperti dibawah ini.

```
public function up()
{
    Schema::create('posts', function (Blueprint $table) {
        $table->id();
        $table->foreignId('category_id');
        $table->foreignId('user_id');
        $table->string('title');
        $table->string('slug')->unique;
        $table->text('excerpt');
        $table->text('body');
        $table->timestamp('published_at')->nullable();
        $table->timestamps();
    });
}
```

7. Selain posts, buat juga migration table users dengan struktur seperti ini

```
public function up()
{
    Schema::create('users', function (Blueprint $table) {
        $table->id();
        $table->string('name');
        $table->string('username');
        $table->string('email')->unique();
        $table->timestamp('email_verified_at')->nullable();
        $table->string('password');
        $table->rememberToken();
        $table->timestamps();
    });
}
```

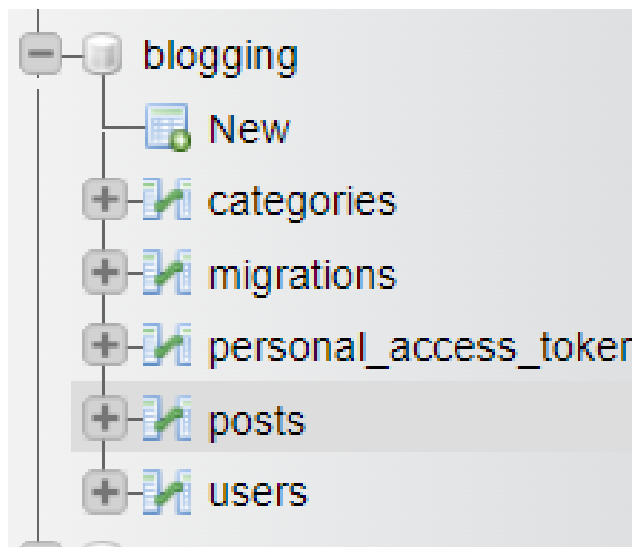

8. Dan juga migration categories dengan struktur dibawah ini.

```

public function up()
{
    Schema::create('categories', function (Blueprint $table) {
        $table->id();
        $table->string('name')->unique();
        $table->string('slug')->unique();
        $table->timestamps();
    });
}

```

9. Ketikkan perintah “php artisan migrate:fresh” pada terminal.

10. Silahkan isi tabel2 berikut dengan contoh isian seperti dibawah ini

- Table categories

| id | name            | slug            | created_at | updated_at |
|----|-----------------|-----------------|------------|------------|
| 1  | Web Programming | web-programming | NULL       | NULL       |
| 2  | Android         | android         | NULL       | NULL       |
| 3  | Personal        | personal        | NULL       | NULL       |
| 4  | Daily Project   | daily-project   | NULL       | NULL       |

- Table posts (user\_id dikosongkan saja terlebih dahulu)

| id | category_id | user_id | title                 | slug                  | excerpt   | body  | publish |
|----|-------------|---------|-----------------------|-----------------------|---|---|---------|
| 1  | 1           | 12      | Judul Tulisan Pertama | judul-tulisan-pertama | Halooo ini adalah teks artikel tulisan pertama.           | Halooo ini adalah teks artikel tulisan pertama. Lo...     | NULL    |
| 2  | 2           | 11      | Judul Tulisan Kedua   | judul-tulisan-kedua   | Halooo ini adalah teks artikel tulisan kedua.             | Halooo ini adalah teks artikel tulisan kedua. LoLo...     | NULL    |
| 3  | 1           | 10      | Judul Tulisan Ketiga  | judul-tulisan-ketiga  | Halooo ini adalah teks artikel tulisan ketiga.            | Halooo ini adalah teks artikel tulisan ketiga. LoL...     | NULL    |
| 4  | 3           | 12      | Judul Tulisan Keempat | judul-tulisan-keempat | Halooo ini adalah teks artikel tulisan keempat.           | Halooo ini adalah teks artikel tulisan keempat. Lo...     | NULL    |
| 5  | 4           | 11      | test 123              | test-123              | Lorem ipsum dolor sit amet, consectetur adipiscing...     | Lorem ipsum dolor sit amet, consectetur adipiscing...     | NULL    |
| 8  | 3           | 11      | post baru nih         | post-baru-nih         | Post baru nih. Lorem ipsum dolor sit amet, consectetur... | Post baru nih. Lorem ipsum dolor sit amet, consectetur... | NULL    |

## MENAMPILKAN TABLE POST MENGGUNAKAN LARAVEL

1. Buat file dengan nama posts.blade.php pada resource/view dengan isi sebagai berikut

```
@extends('layout.main')
```

```
@section('container')
```

```
<span align="center" ><h2>Halaman {{$title}}</h2></span>
```

```
@foreach($posts as $post)
```

```
<div class="card">
```

```
<div class="card-header">
```

```
{{$title}}
```

```
</div>
```

```
<div class="card-body">
```

```
<h5 class="card-title"><?= $post->title; ?></h5>
```

```
<p class="card-text"><?= $post->excerpt; ?></p>
```

```
<!-- <a href="/posts/{{$post['slug']}}" class="btn btn-primary">Read More</a> -->
```

```

        <a href="/posts/{{ $post->slug }}" class="btn btn-primary">Read More</a>

    </div>

</div>

<br>

@endforeach

@endsection

```

2. Buat file dengan nama `post.blade.php` dengan isi sebagai berikut

```

@extends('layout.main')

@section('container')

<div class="card">

    <div class="card-header">

        {{ $title }}

    </div>

    <div class="card-body">

        <h5 class="card-title"><?= $post->title; ?></h5>

        <!-- <?= $post["body"]; ?><br><br> -->

        {!! $post->body !!}<br>

        <a href=".." /posts" class="btn btn-primary">Back To Posts</a>

    </div>

</div>

<br>

@endsection

```

3. Tambahkan perintah rute berikut pada `web.php`

```

Route::get('/posts', [PostController::class, 'index']);

Route::get('/posts/{post:slug}', [PostController::class, 'show']);

```

4. Lalu tambahkan perintah dibawah ini pada bagian atas web.php

```
use App\Models\Post;
```

```
use App\Http\Controllers\PostController;
```

5. Klik CTRL + SHIFT + P, lalu ketik "CONTROLLER" -> enter->PostController untuk membuat controller. Lalu tambahkan script berikut.

```
public function index(){  
  
    return view('posts',[  
  
        "title" => "All Posts",  
  
        "active"=>'posts',  
  
        "posts" =>Post::all()  
  
    ]);  
  
}
```

```
public function show(Post $post){  
  
    return view('post',[  
  
        "title" =>"Single Post",  
  
        "active"=>'posts',  
  
        "post" => $post  
  
    ]);  
  
}
```

6. Lalu tambahkan perintah "use App\Models\Post;" dibagian atas class controllernya.
7. Klik CTRL+SHIFT+P, ketik MODEL->Post. Untuk membuat model dengan nama Post. Lalu tambahkan perintah "protected \$guarded=['id'];"
8. Buka terminal dan ketikkan "php artisan serve" untuk menjalankan web. Dan tampilan akan muncul sebagai berikut

## Task 2:

1. SILAHKAN IMPLEMENTASIKAN TABLE COMMENTS DENGAN STRUKTUR DIBAWAH DENGAN ALUR YANG SAMA SEPERTI POSTS DAN POST DIATAS!

| <input type="checkbox"/> | 1 | id           | bigint(20)                      | UNSIGNED | No  | None | AUTO_INCREMENT | <a href="#">Change</a> | <a href="#">Drop</a> | <a href="#">More</a> |
|--------------------------|---|--------------|---------------------------------|----------|-----|------|----------------|------------------------|----------------------|----------------------|
| <input type="checkbox"/> | 2 | category_id  | bigint(20)                      |          | No  | None |                | <a href="#">Change</a> | <a href="#">Drop</a> | <a href="#">More</a> |
| <input type="checkbox"/> | 3 | slug         | varchar(255) utf8mb4_unicode_ci |          | No  | None |                | <a href="#">Change</a> | <a href="#">Drop</a> | <a href="#">More</a> |

# MENAMBAHKAN FITUR SEARCH DAN PAGINATION PADA POSTS

## LARAVEL

1. Modifikasi file posts.blade.php menjadi seperti dibawah ini:

```
@extends('layout.main')

@section('container')

<span align="center" ><h2>Halaman {{$title}}</h2></span>

<div class="row justify-content-center mb-3">

    <div class="col-md-6">

        <form action="/posts" method="get">

            <div class="input-group mb-3">

                <input type="text" class="form-control" placeholder="Search.." name="search"
value="{{$request('search')}}">

                <button class="btn btn-primary" type="submit" id="button-addon2">Search</button>

            </div>

        </form>

    </div>

</div>

@foreach($posts as $post)

<div class="card">

    <div class="card-header">

        {{$title}}

    </div>

    <div class="card-body">

        <h5 class="card-title"><?= $post->title; ?></h5>

        <p class="card-text"><?= $post->excerpt; ?></p>

    </div>

</div>

</div>

</div>
```

```

<!-- <a href="/posts/{{ $post['slug'] }}" class="btn btn-primary">Read More</a> -->

<a href="/posts/{{ $post->slug }}" class="btn btn-primary">Read More</a>

</div>

</div>

<br>

@endforeach

<div class="d-flex justify-content-end">

    {{ $posts->links() }}

</div>

@endsection

```

## 2. Ubah index pada PostController menjadi

```

public function index(){

    // dd(request('search'));

    return view('posts',[

        "title" => "All Posts",

        "active"=>'posts',

        // "posts" =>Post::latest()->filter(request(['search']))->get(),

        "posts" =>Post::latest()->filter(request(['search']))->paginate(2)->withQueryString()

    ]);

}

```

## 3. Tambahkan function scopeFilter pada model Post.php

```

public function scopeFilter($query, array $filters)

```

```

{
    $query->when($filters['search'] ?? false, function ($query, $search){
        return $query->where('title','like','%'.$search.'%')
        ->orWhere('body','like','%'.$search.'%');
    });
}

```

#### 4. Tambahkan script pada Providers/AppProvider.php

```
use Illuminate\Pagination\Paginator;
```

```
public function boot()
```

```

{
    Paginator::useBootstrap();
}

```

## MENAMBAHKAN CATEGORIES PADA POST

### 1. Buat table bernama categories dengan struktur seperti dibawah ini:

| # | Name               | Type         | Collation          | Attributes | Null | Default | Comments | Extra          |
|---|--------------------|--------------|--------------------|------------|------|---------|----------|----------------|
| 1 | <b>id</b> 🔑        | bigint       |                    | UNSIGNED   | No   | None    |          | AUTO_INCREMENT |
| 2 | <b>name</b> 🔑      | varchar(255) | utf8mb4_unicode_ci |            | No   | None    |          |                |
| 3 | <b>slug</b> 🔑      | varchar(255) | utf8mb4_unicode_ci |            | No   | None    |          |                |
| 4 | <b>description</b> | varchar(200) | utf8mb4_unicode_ci |            | No   | None    |          |                |
| 5 | <b>created_at</b>  | timestamp    |                    |            | Yes  | NULL    |          |                |
| 6 | <b>updated_at</b>  | timestamp    |                    |            | Yes  | NULL    |          |                |

### 2. Lalu isi tabel tersebut dengan data sebagai berikut, selain itu pastikan juga field category\_id pada tabel post sudah terisi

| id | name            | slug            | description   |
|----|-----------------|-----------------|---|
| 1  | Web Programming | web-programming | Berikut adalah kumpulan postingan tentang Web Prog... |
| 2  | Android         | android         | Berikut adalah kumpulan postingan tentang Android     |
| 3  | Personal        | personal        | Berikut adalah kumpulan postingan tentang Personal    |
| 4  | Daily Project   | daily-project   | Berikut adalah kumpulan postingan tentang Daily Pr... |

3. Tambahkan route pada web dibawah ini

```
Route::get('/categories', [CategoryController::class, 'index']);
```

```
Route::get('categories/{category:slug}', function(Category $category){
    return view('category',[
        'title'=>$category->name,
        'posts'=>$category->posts,
        'category'=>$category->name
    ]);
});
```

4. Tambahkan perintah **“use App\Http\Controllers\CategoryController;”** Pada bagian atas web.php.

5. Buat model dengan nama Category.php dengan isi model seperti ini

```
use HasFactory;

protected $guarded = ['id'];

public function posts()
{
    return $this->hasMany(Post::class);
}
```

6. Buat file controller dengan CategoryController dengan isi file:

```
public function index()
{
    return view('categories', [
        'categories' => Category::all(),
        'posts' => Post::all()
    ]);
}
```

7. Tambahkan perintah **“use App\Models\Post;”** dan **“use App\Models\Category;”** pada file CategoryController.php.

8. Buat file dengan nama category.blade.php yang berisi

```
@extends('layout.main')

@section('container')

<h3> Post Category : {{$category}}</h3>

<div class="row row-cols-1 row-cols-md-2 g-4">

    <div class="col">

        @foreach($posts as $post)

            <div class="card">

                <!-- 

                <div class="card-body">

                    <h5 class="card-title">

                        <a href="/posts/{{$post->slug}}">{{$post->title}}</a>

                    </h5>

                    <p class="card-text">{{$post->excerpt}}</p>

                </div>

            </div><br>

        @endforeach

    </div></div>
```

```
</div>
```

```
</div>
```

```
@endsection
```

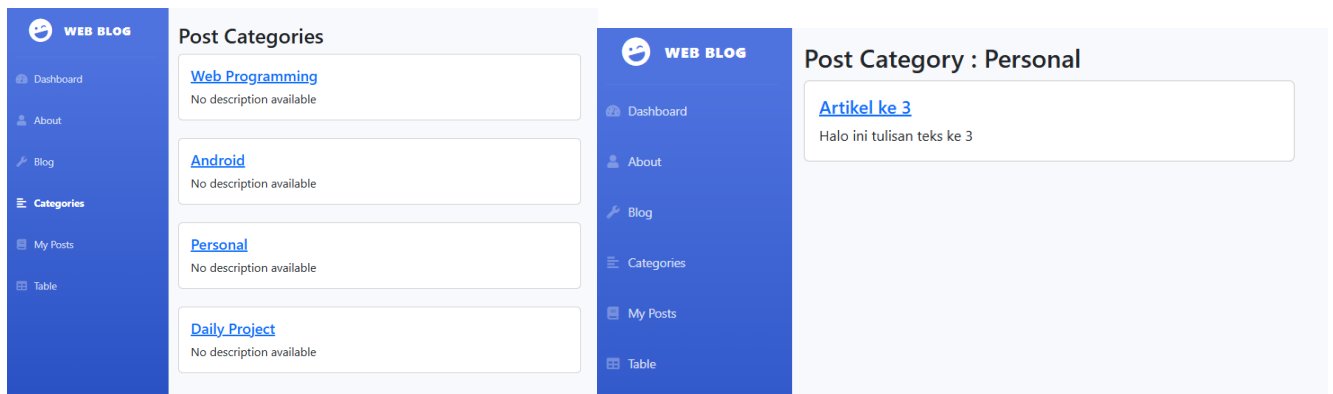

9. Buat file view dengan nama `categories.blade.php`. Lalu isi dengan file:

```
@extends('layout.main')
@section('container')
<h3>Post Categories</h3>
<div class="row row-cols-1 row-cols-md-2 g-4">
  <div class="col">
    @foreach($categories as $category)
      <div class="card">
        <div class="card-body">
          <h5 class="card-title">
            <a href="/categories/{{ $category->slug }}">{{ $category->name }}</a>
          </h5>
          <p class="card-text">
            {{ $category->description ?? 'No description available' }}
          </p>
        </div>
      </div><br>
    @endforeach
  </div>
</div>
@endsection
```

10. Buka file `main.blade.php` lalu tambahkan script:

```
<li class="nav-item {{ Request::is('categor*') ? 'active' : '' }}">
  <a class="nav-link" href="/categories">
    <i class="fas fa-fw fa-align-left"></i>
    <span>Categories</span></a>
</li>
```

SETELAH DIBUAT, MAKA AKAN MENAMPILKAN TAMPILAN KATEGORI SEPERTI DIBAWAH INI:

### Task 3 :

1. TAMBAHKAN FITUR SEARCH, PAGINATION DAN CATEGORY PADA FIELD COMMENTS DAN TAMPIKAN!

## MEMBUAT FITUR LOGIN DAN REGISTER PADA LARAVEL

1. Tambahkan perintah dibawah pada web.php

```
Route::post('/login', [LoginController::class,'authenticate']);
```

```
Route::post('/register', [RegisterController::class,'store']);
```

```
Route::group(['middleware' => ['guest']],function() {
```

```
Route::get('/login', [LoginController::class,'index'])->name('login');
```

```
Route::get('/register', [RegisterController::class,'index']);
```

```
});
```

```
Route::get('/logout', [LoginController::class,'logout'])->name('logout');
```

```
Route::get('/dashboard',function () {
```

```
    return view('dashboard.index');
```

```
});
```

2. Tambahkan perintah dibawah diawal file web.php

```
use App\Http\Controllers\LoginController;
```

```
use App\Http\Controllers\RegisterController;
```

3. Buat controller dengan nama LoginController dan RegisterController
4. Isi file LoginController dengan file dibawah ini

```
public function index()

{

    return view('login.index',[

        'title'=>'Login'

    ]);

}

public function authenticate(Request $request)

{

    $credentials = $request->validate([

        'email'=>'required|email:dns',

        'password'=>'required'

    ]);

    if (Auth::attempt($credentials)) {

        $request->session()->regenerate();

        return redirect()->intended('/login');

    }

    return back()->with('loginError','Login Failed!');

}

public function logout(Request $request)

{

    Auth::logout();

    $request->session()->invalidate();

    $request->session()->regenerateToken();

}
```

```

        return redirect('/');
    }

```

5. Tambahkan perintah “use Illuminate\Support\Facades\Auth;” pada bagian atas LoginController.
6. Buat folder dan file dengan nama login/index.blade.php didalam folder view. Dengan isian file sebagai berikut

```

<!DOCTYPE html>

<html lang="en">

<head>

    <meta charset="utf-8">

    <meta http-equiv="X-UA-Compatible" content="IE=edge">

    <meta name="viewport" content="width=device-width, initial-scale=1, shrink-to-fit=no">

    <meta name="description" content="">

    <meta name="author" content="">

    <title>Halaman Login</title>

    <!-- Custom fonts for this template-->

    <link href="vendor/fontawesome-free/css/all.min.css" rel="stylesheet" type="text/css">

```

```
<!-- Outer Row -->
```

```
<div class="row justify-content-center">
```

```
<div class="col-xl-10 col-lg-12 col-md-9">
```

```
@if(session()->has('success'))
```

```
<div class="alert alert-light alert-dismissible fade show" role="alert">
```

```
{{ session('success') }}
```

```
<button type="button" class="btn-close" data-bs-dismiss="alert" aria-
label="Close"></button>
```

```
</div>
```

```
@endif
```

```
@if(session()->has('loginError'))
```

```
<div class="alert alert-danger alert-dismissible fade show" role="alert">
```

```
{{ session('loginError') }}
```

```
<button type="button" class="btn-close" data-bs-dismiss="alert" aria-
label="Close"></button>
```

```
</div>
```

```
@endif
```

```

<div class="card o-hidden border-0 shadow-lg my-5">

    <div class="card-body p-0">

        <!-- Nested Row within Card Body -->

        <div class="row">

            <div class="col-lg-6 d-none d-lg-block bg-login-image"></div>

            <div class="col-lg-6">

                <div class="p-5">

                    <div class="text-center">

                        <h1 class="h4 text-gray-900 mb-4">Welcome Back!</h1>

                    </div>

                    <form class="user" action="/login" method="post">

                        @csrf

                        <div class="form-group">

                            <input name="email" type="email" class="form-control form-control-
user @error('email') is-invalid @enderror"

                                id="exampleInputEmail" aria-describedby="emailHelp"

                                placeholder="Email" autofocus required>

                                    @error('email')

                                <div class="invalid-feedback">

                                    {{ $message }}

                                </div>

                                    @enderror

                                </div>

                                <div class="form-group">

```

```

        <input name="password" type="password" class="form-control form-
control-user"

        id="exampleInputPassword" placeholder="Password" required>

    </div>

    <div class="form-group">

        <div class="custom-control custom-checkbox small">

            <input type="checkbox" class="custom-control-input"
id="customCheck">

            <label class="custom-control-label" for="customCheck">Remember
                Me</label>

        </div>

    </div>

    <button class="btn btn-primary btn-user btn-block">

        Login

    </button>

</form>

<hr>

<div class="text-center">

    <a class="small" href="/register">Create an Account!</a>

</div>

</div>

</div>

</div>

</div>

```

```

        </div>

    </div>

</div>

</div>

<!-- Bootstrap core JavaScript-->

<script src="vendor/jquery/jquery.min.js"></script>

<script src="vendor/bootstrap/js/bootstrap.bundle.min.js"></script>

<!-- Core plugin JavaScript-->

<script src="vendor/jquery-easing/jquery.easing.min.js"></script>

<!-- Custom scripts for all pages-->

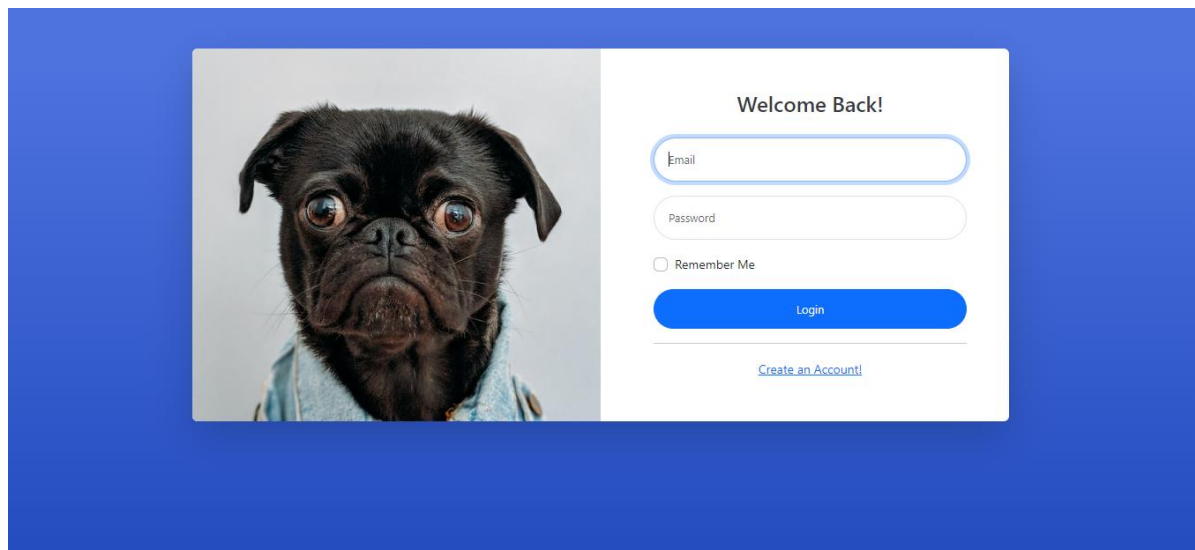

<script src="js/sb-admin-2.min.js"></script>

</body>

</html>

```

7. Coba running dan akan muncul tampilan login seperti dibawah ini

8. Isi file RegisterController dengan file dibawah ini

```

public function index()

{

```

```

return view('register.index',[

    'title' => 'Register',

    'active' => 'register'

]);

}

public function store(Request $request)
{

    $validatedData=$request->validate([

        'name'=>'required|max:255',

        'username'=>['required','min:3','max:255','unique:users'],

        'email'=>'required|email|unique:users|email:dns',

        'password'=>'required|min:5|max:255'

    ]);

    $validatedData['password']=Hash::make($validatedData['password']);

    User::create($validatedData);

    return redirect('/login')->with('success','Registration Successfull!! Please Login');

}

```

9. Tambahkan perintah “use App\Models\User;” dan “use Illuminate\Support\Facades\Hash;” pada awal RegisterController.

10. Buat folder dan file dengan nama register/index.blade.php didalam folder view dengan isi file sebagai berikut

```

<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="utf-8">
    <meta http-equiv="X-UA-Compatible" content="IE=edge">
    <meta name="viewport" content="width=device-width, initial-scale=1, shrink-to-fit=no">
    <meta name="description" content="">

```

```

<meta name="author" content="">
<title>Register</title>
<!-- Custom fonts for this template-->
<link href="vendor/fontawesome-free/css/all.min.css" rel="stylesheet" type="text/css">
<link
href="https://fonts.googleapis.com/css?family=Nunito:200,200i,300,300i,400,400i,600,600i,
700,700i,800,800i,900,900i"
rel="stylesheet">
<!-- Custom styles for this template-->
<link href="css/sb-admin-2.min.css" rel="stylesheet">
</head>
<body class="bg-gradient-primary">
<div class="container">
<div class="card o-hidden border-0 shadow-lg my-5">
<div class="card-body p-0">
<!-- Nested Row within Card Body -->
<div class="row">
<div class="col-lg-5 d-none d-lg-block bg-register-image"></div>
<div class="col-lg-7">
<div class="p-5">
<div class="text-center">
<h1 class="h4 text-gray-900 mb-4">Create an Account!</h1>
</div>
<form action="/register" method="POST" class="user">
@csrf
<div class="form-group">
<input type="text" name="name" class="form-control form-control-
user @error('name') is-invalid @enderror" id="exampleFirstName" placeholder="Name"
required value="{{ old('name') }}">
@error('name')
<div class="invalid-feedback">
{{ $message }}
</div>

```

```

        @enderror
    </div>
    <div class="form-group">
        <input type="text" name="username" class="form-control form-
control-user @error('username') is-invalid @enderror" id="exampleFirstName"
placeholder="Username" required value="{{ old('username') }}">
        @error('username')
        <div class="invalid-feedback">
            {{ $message }}
        </div>
        @enderror
    </div>
    <div class="form-group">
        <input type="email" name="email" class="form-control form-control-
user @error('email') is-invalid @enderror" id="exampleInputEmail" placeholder="Email
Address" required value="{{ old('email') }}">
        @error('email')
        <div class="invalid-feedback">
            {{ $message }}
        </div>
        @enderror
    </div>
    <div class="form-group">
        <input type="password" name="password" class="form-control form-
control-user @error('password') is-invalid @enderror"
id="exampleInputPassword" placeholder="Password" required
value="{{ old('password') }}">
        @error('password')
        <div class="invalid-feedback">
            {{ $message }}
        </div>
        @enderror
    </div>
    <button class="btn btn-primary btn-user btn-block">

```

```

        Register Account
    </button>
</form>
<hr>
<div class="text-center">
    <a class="small" href="/login">Already have an account? Login!</a>
</div>
</div>
</div>
</div>
</div>
</div>
</div>
</div>
</div>
<!-- Bootstrap core JavaScript-->
<script src="vendor/jquery/jquery.min.js"></script>
<script src="vendor/bootstrap/js/bootstrap.bundle.min.js"></script>
<!-- Core plugin JavaScript-->
<script src="vendor/jquery-easing/jquery.easing.min.js"></script>
<!-- Custom scripts for all pages-->
<script src="js/sb-admin-2.min.js"></script>
</body>

</html>

```

11. Buka file user.php pada model dan modifikasi script sebagai berikut

```

class user extends Authenticatable
{
    use HasFactory;

    protected $table = 'users';

    protected $hidden = [

        'password',

        'remember_token'
    ]
}

```

```

];

// protected $fillable = [

//     'name',

//     'username',

//     'email',

//     'password'

// ];

protected $guarded=['id'];

protected $casts = [

    'email_verified_at' => 'datetime'

    // , 'password' => 'hashed'

];

}

```

12. Jika sudah, jalankan dan tampilannya akan sebagai berikut

13. Coba daftarkan 5 user dengan fitur create user yang telah dibuat!

14. Tambahkan perintah dibawah pada file layout/main.blade.php

```

<!-- Content Wrapper -->

<div id="content-wrapper" class="d-flex flex-column">

    <!-- Main Content -->

    <div id="content">

        <!-- Topbar -->

        <nav class="navbar navbar-expand navbar-light bg-white topbar mb-4 static-top
shadow">

            <ul class="navbar-nav ml-auto">

                @auth

                <li class="nav-item dropdown">

                    <a class="nav-link dropdown-toggle" href="#" role="button" data-bs-
toggle="dropdown" aria-expanded="false">

                        Welcome Back, {{ auth()->user()->name}}

                    </a>

                    <ul class="dropdown-menu">

                        <li><a class="dropdown-item" href="/dashboard">My Dashboard</a></li>

                        <li><hr class="dropdown-divider"></li>

                        <li>

                            <form action="{{route('logout')}}" action="GET">

                                @csrf

                                <button type="submit" class="dropdown-item">

                                    <i class="bi bi-box-arrow-right"></i> Logout</a></li>

                            </form>

                        </li>

                    </ul>

                </li>

```

```

    @else

        <li>

            <a href="/login" class="nav-link">

                <i class="bi bi-box-arrow-in-right"></i> Login</a>

            </li>

        @endauth

    </ul>

</nav>

<div class="container mt-4">

    @yield('container')

</div>

</div>

</div>

```

15. Buat folder dan file dengan nama dashboard/index.blade.php didalam folder view dengan isi

```

@extends('layout.main')

@section('container')

<span align="center" ><h2>Halaman Dashboard</h2></span>

    <form class="d-none d-sm-inline-block form-inline mr-auto ml-md-3 my-2 my-md-0 mw-100 navbar-search">

        </form>

    @endsection

```

16. Buka models Users.php dan modifikasi file menjadi dibawah ini

```

class user extends Authenticatable

{

    use HasFactory;

```

```

protected $table = 'users';

protected $hidden = [

    'password',

    'remember_token'

];

// protected $fillable = [

//     'name',

//     'username',

//     'email',

//     'password'

// ];

protected $guarded=['id'];

protected $casts = [

    'email_verified_at' => 'datetime'

    // , 'password' => 'hashed'

];

}

```

17. Jika sudah, maka akan muncul tampilan seperti dibawah Ketika sudah berhasil login

18. Buka file web.php lalu modifikasi semua route menjadi didalam perintah

```
Route::group(['middleware' => ['auth']],function () { //seluruh route });
```

```
Route::get('/home', function () {
```

```
return redirect('/dashboard');
```

```
Route::group(['middleware' => ['auth']],function () {  
  
    Route::get('/', function () {  
        return view('about',[  
            'title'=>"Home",  
            'active'=>'home'  
        ]);  
    });  
    Route::get('/posts', [PostController::class,'index']);  
    Route::get('/posts/{post:slug}',  
    [PostController::class, 'show']);  
  
    Route::get('categories', function(){  
        return view('categories',[  
            'title'=>'Post Categories',  
            'posts'=>Category::all()  
        ]);  
    });  
});  
Route::get('categories/{category:slug}', function(Category $category){  
    return view('category',[  
        'title'=>{$category->name,  
        'posts'=>{$category->posts,  
        'category'=>{$category->name  
    });  
});  
  
Route::get('/logout', [LoginController::class,'logout'])->name('logout');  
Route::get('/dashboard',function () {  
    return view('dashboard.index');  
});  
});
```

Lalu beri tutup " }); " sebelum Route::group(['middleware' => ['guest']], .....

## MEMBUAT FITUR INSERT DAN TAMPIL DATA POSTINGAN

1. Tambahkan field `user_id` pada tabel `posts` dibawah `category_id`, lalu isi dengan id yang tersedia pada table `users`.

| #  | Name                | Type         | Collation          | Attributes | Null | Default | Comments | Extra          |
|----|---------------------|--------------|--------------------|------------|------|---------|----------|----------------|
| 1  | <b>id</b> 🔑         | bigint(20)   |                    | UNSIGNED   | No   | None    |          | AUTO_INCREMENT |
| 2  | <b>category_id</b>  | bigint(20)   |                    | UNSIGNED   | No   | None    |          |                |
| 3  | <b>user_id</b>      | varchar(10)  | utf8mb4_unicode_ci |            | No   | None    |          |                |
| 4  | <b>title</b>        | varchar(255) | utf8mb4_unicode_ci |            | No   | None    |          |                |
| 5  | <b>slug</b>         | varchar(255) | utf8mb4_unicode_ci |            | No   | None    |          |                |
| 6  | <b>excerpt</b>      | text         | utf8mb4_unicode_ci |            | No   | None    |          |                |
| 7  | <b>body</b>         | text         | utf8mb4_unicode_ci |            | No   | None    |          |                |
| 8  | <b>published_at</b> | timestamp    |                    |            | Yes  | NULL    |          |                |
| 9  | <b>created_at</b>   | timestamp    |                    |            | Yes  | NULL    |          |                |
| 10 | <b>updated_at</b>   | timestamp    |                    |            | Yes  | NULL    |          |                |

2. Buat folder `post` didalam folder `view/dashboard`

3. Buat file dengan nama `showpost.blade.php` dengan isi sebagai berikut

```
@extends('layout.main')

@section('container')

<div class="card">

    <div class="card-header">

    </div>

    <div class="card-body">

        <h5 class="card-title"> {{ $post->title; }}</h5>
```

```

<a href="/dashboard/post" class="btn btn-success"><span data-feather="arrow-
left"></span> Back to all posts</a>

<a href="/dashboard/post/{{ $post->slug }}/edit" class="btn btn-warning"><span data-
feather="edit"></span> Edit</a>

<form action="/dashboard/post/{{ $post->slug }}" method="post" class="d-inline">

    @method('delete')

    @csrf

    <button class="btn btn-danger border-0" onclick="return confirm('Are you sure?')"><span
data-feather="x-circle"></span> Delete</button>

</form>

<!-- <? $post["body"]; ?><br><br> -->

<br>

{!! $post->body !!}

<br>

</div>

</div>

<br>

@endsection

```

4. Buat file dengan nama create.blade.php dengan isi sebagai berikut

```

@extends('layout.main')

@section('container')

<span align="center" ><h2>Create New Post</h2></span>

<div class="col-lg-8">

<form method="post" action="/dashboard/post">

    @csrf

    <div class="mb-3">

```

```

<label for="title" class="form-label">Title</label>

<input type="text" class="form-control @error('title') is-invalid @enderror" id="title"
name="title" required autofocus value="{{ old('title') }}">

    @error('title')

    <div class="invalid-feedback">

        {{$message}}

    </div>

    @enderror

</div>

<div class="mb-3">

    <label for="slug" class="form-label">Slug</label>

    <input type="text" class="form-control @error('slug') is-invalid @enderror" id="slug"
name="slug" required value="{{ old('slug') }}">

    @error('slug')

    <div class="invalid-feedback">

        {{$message}}

    </div>

    @enderror

</div>

<div class="mb-3">

    <label for="category" class="form-label">Category</label>

    <select name="category_id" id="category_id" class="form-select">

        @foreach($categories as $category)

            <option value="{{ $category->id }}">{{ $category->name }}</option>

        @endforeach

```

```

</select>

</div>

<div class="mb-3">

  <label for="body" class="form-label">Body</label>

  <textarea name="body" id="body" class="form-control" cols="10" rows="5" value="{{
old('body')}}"></textarea>

  @error('body')

  <p class="text-danger">{{$message}}</p>

  @enderror

</div>

<button type="submit" class="btn btn-primary">Create Post</button>

</form>

</div>

<script>

const title = document.querySelector('#title');

const slug = document.querySelector('#slug');

title.addEventListener('change',function(){

  fetch('/dashboard/post/checkSlug?title=' + title.value)

  .then(response=>response.json())

  .then(data=>slug.value=data.slug)

});

</script>

@endsection

```

5. Buat file dengan nama index.blade.php dengan isi sebagai berikut

```
@extends('layout.main')
```

```

@section('container')

<h2>My Posts</h2>

@if(session()->has('success'))

<div class="alert alert-success" role="alert">

    {{session('success')}}

</div>

@endif

<div class="table-responsive col-lg-8">

<a href="/dashboard/post/create" class="btn btn-primary mb-3">Create new post</a>

<table class="table table-striped table-hover">

<thead>

<tr>

<th scope="col">#</th>

<th scope="col">Title</th>

<th scope="col">Category</th>

<th scope="col">Action</th>

</tr>

</thead>

<tbody>

@foreach ($posts as $post)

<tr>

<th scope="row">{{ $loop->iteration }}</th>

<td>{{ $post->title }}</td>

<td>{{ $post->category->name }}</td>

<td>

```

```

<a href="/dashboard/post/{{ $post->slug }}" class="badge bg-info"><span data-
feather="eye"></span></a>

<a href="/dashboard/post/{{ $post->slug }}/edit" class="badge bg-warning"><span data-
feather="edit"></span></a>

<form action="/dashboard/post/{{ $post->slug }}" method="post" class="d-inline">

    @method('delete')

    @csrf

    <button class="badge bg-danger border-0" onclick="return confirm('Are you sure?')"><span
data-feather="x-circle"></span></button>

</form>

</td>

</tr>

@endforeach

</tbody>

</table>

</div>

@endsection

```

6. Buka file web.php, lalu tambahkan route didalam group auth sebagai berikut

```
Route::get('/dashboard/post/checkSlug', [TabPostController::class, 'checkSlug']);
```

```
Route::resource('/dashboard/post', TabPostController::class);
```

7. Tambahkan perintah pada bagian atas web.php dengan

```
use App\Http\Controllers\TabPostController;
```

8. Buat controller dengan nama TabPostController.php dengan tipe “Resource” tanpa harus membuat model. Lalu isi file pada bagian public class index nya sebagai berikut

```

public function index()

{

```

```

return view('dashboard.post.index',[
    'posts'=> Post::where('user_id', auth()->user()->id)->get()
]);
}

```

9. Tambahkan public class create nya menjadi seperti ini

```

public function create()
{
    return view('dashboard.post.create',[
        'categories'=>Category::all()
    ]);
}

```

10. Tambahkan public class store nya menjadi seperti ini

```

public function store(Request $request)
{
    $validatedData=$request->validate([
        'title'=>'required|max:255',
        'slug'=>'required|unique:posts',
        'category_id'=>'required',
        'body'=>'required'
    ]);

    $validatedData['user_id']=auth()->user()->id;

    $validatedData['excerpt']=Str::limit(strip_tags($request->body), 200);

    Post::create($validatedData);

    return redirect('/dashboard/post')->with('success','New Post has been added!');
}

```

11. Tambahkan public function view nya menjadi seperti ini

```
public function show(Post $post)

{

    return view('dashboard.post.showpost',[

        'post'=>$post

    ]);

}
```

12. Tambahkan public function checkSlug pada bagian bawah dengan script seperti ini

```
public function checkSlug(Request $request)

{

    $slug = SlugService::createSlug(Post::class,'slug',$request->title);

    return response()->json(['slug'=>$slug]);

}
```

13. Tambahkan perintah dibawah pada bagian atas TabPostController

```
use App\Models\Post;

use App\Models\Category;

use \Cviebrock\EloquentSluggable\Services\SlugService;

use Illuminate\Support\Str;
```

14. Buka file model Post.php dan tambahkan script dibawah ini

```
public function getRouteKeyName(){

    return 'slug';

}

public function sluggable(): array{

    return[

        'slug'=>[
```

```

        'source'=>'title'
    ]

};

}

```

15. Tambahkan script “use Cviebrock\EloquentSluggable\Sluggable;” pada bagian atas Post.php
16. Jalankan perintah “composer require cviebrock/eloquent-sluggable” hingga berhasil
17. Tambahkan perintah “, Sluggable” disamping HasFactory pada model post.php.
18. Jika sudah, coba jalankan kode program sehingga muncul tampilan data postingan sebagai berikut

#### Task 4:

1. Buatlah fitur tampil dan insert pada tabel Comments

## MEMBUAT FITUR EDIT DAN DELETE DATA PADA POSTINGAN

1. Pada folder dashboard/post buat file dengan nama edit.blade.php dengan isi sebagai berikut

```
@extends('layout.main')
```

```
@section('container')
```

```
<span align="center" ><h2>Edit Post</h2></span>
```

```
<div class="col-lg-8">
```

```
<form method="post" action="/dashboard/post/{{ $post->slug }}">
```

```
@method('put')
```

```

@csrf

<div class="mb-3">

    <label for="title" class="form-label">Title</label>

    <input type="text" class="form-control @error('title') is-invalid @enderror" id="title"
name="title" required autofocus value="{{ old('title', $post->title)}}">

    @error('title')

    <div class="invalid-feedback">

        {{$message}}

    </div>

    @enderror

</div>

<div class="mb-3">

    <label for="slug" class="form-label">Slug</label>

    <input type="text" class="form-control @error('slug') is-invalid @enderror" id="slug"
name="slug" required value="{{ old('slug', $post->slug)}}">

    @error('slug')

    <div class="invalid-feedback">

        {{$message}}

    </div>

    @enderror

</div>

<div class="mb-3">

    <label for="category" class="form-label">Category</label>

    <select name="category_id" id="category_id" class="form-select">

        @foreach($categories as $category)

```

```

@if(old('category_id',$post->category_id)==$category->id)

<option value="{{ $category->id }}" selected>{{ $category->name }}</option>

@else

<option value="{{ $category->id }}">{{ $category->name }}</option>

@endif

@endforeach

</select>

</div>

<div class="mb-3">

<label for="body" class="form-label">Body</label>

<textarea name="body" id="body" class="form-control" cols="10" rows="5">{{ old('body',
$post->body) }}</textarea>

@error('body')

<p class="text-danger">{{ $message }}</p>

@enderror

</div>

<button type="submit" class="btn btn-primary">Update Post</button>

</form>

</div>

<script>

const title = document.querySelector('#title');

const slug = document.querySelector('#slug');

```

```

title.addEventListener('change',function(){

    fetch('/dashboard/post/checkSlug?title=' + title.value)

    .then(response=>response.json())

    .then(data=>slug.value=data.slug)

});

</script>

```

@endsection

2. Buka file TabPostController.php lalu tambahkan script pada public function edit

```

public function edit(Post $post)

{

    return view('dashboard.post.edit',[

        'post'=>$post,

        'categories'=>Category::all()

    ]);

}

```

3. Tambahkan script pada public function update

```

public function update(Request $request, Post $post)

{

    $rules=[

        'title'=>'required|max:255',

        'category_id'=>'required',

        'body'=>'required'

    ];

}

```

```

if($request->slug != $post->slug){

    $rules['slug'] = 'required|unique:posts';

}

$validatedData = $request->validate($rules);

$validatedData['user_id']=auth()->user()->id;

$validatedData['excerpt']=Str::limit(strip_tags($request->body), 200);

Post::where('id',$post->id)

->update($validatedData);

return redirect('/dashboard/post')->with('success','Post has been updated!');

}

```

#### 4. Tambahkan script pada public function destroy

```

public function destroy(Post $post)

{

    Post::destroy($post->id);

    return redirect('/dashboard/post')->with('success','Post has been deleted!');

}

```

#### 5. Jika sudah, silahkan jalankan kode program dan coba fitur edit dan hapusnya
